TECHNICAL DEGREE IN CIVIL SERVICE

ABSTRACT

Over the last decades, public policies on higher education have assumed the challenge, among others, of promoting higher education through improvements in finance, convergence between technical training and the productive sector and the creation of information systems. It is necessary to define whether the State, as employer of human resources and potential target for superior technical graduates, offers concessionary terms for including it in different services. According to a cadastre of requirements to enter into the civil service, this article identifies difficulties superior technical graduates face when accessing the civil service and in the exercise itself, ranging from definition of the technical degree to economical benefits they can expect in this sector.

Key words: civil service, technical education at higher level, State, hiring policy
